## AMENDMENTS TO THE CLAIMS

This listing of claims replaces all prior versions, and listing, of claims in the application:

- 1. (Currently Amended) A method for improving throughput in continuous electrodialysis processes to create product, the method comprising automatically neutralizing byproduct acid generated in acid loop solutions residing in an electrodialysis stack by adding a buffer in strong acid/weak base configurations wherein the buffer comprises components of the product or neutralizing byproduct base generated in base-loop solutions residing in an electrodialysis stack by adding a buffer in weak acid/strong base configurations wherein said buffer keeps the solutions in the stack within 2 pH units and also keeps the stack between pH 3 and pH 10.
- (Previously Presented) The method as recited in claim 1 wherein the process involves the formation of an acidic solution in the electrodialysis stack and said buffer is added to the solution.
- (Previously Presented) The method as recited in claim 1 wherein the process involves the formation of a basic solution and said buffer is added to the solution.
  - 4. (Cancelled)
- (Previously Presented) The method as recited in claim 1 wherein the buffering agent is premixed with a solution situated remotely from the stack.
- (Original) The method as recited in claim 1 wherein a buffering agent is added at ambient temperature.

In Re: Hryn (S.N. 10/824,741) Response to Sept 17, 2008 Official Action Page -3-

- (Original) The method as recited in claim 1 wherein the electrodialysis process operates at a temperature which ranges from about 15°C to 40°C.
  - 8. (Cancelled)
- (Previously Presented) The method as recited in claim 1 wherein the anionic and cationic moieties of the buffer are selected to minimize contamination of the product.
- 10. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that will become acidic, a buffer pair is created by adding an acid and a metal hydroxide to the "acid-loop" stream.
- 11. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that is already acidic, a buffer pair is created by adding a metal salt of the acid's conjugate base to the "acid-loop" stream.
- 12. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that will become basic, a buffer pair is created by the addition of a base and its conjugate acid to the "base-loop" stream.
- 13. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that is already basic, a buffer pair is created by the addition of an acid to the "base-loop" stream that contains, as its conjugate base, the base present in the ED electrolyte solution.
- 14. (Currently Amended) A process for preventing pH swings of cationic and anionic electrodialysis membranes in electrodialysis cell compartments to create product, the process comprising controlling the pH of byproduct acid in an acid-loop by adding a buffer wherein the buffer comprises components of the

product or controlling the pH of byproduct base in a base-loop solution by adding a buffer wherein the buffer comprises components of the product, wherein said buffer maintains solutions in the cell to within two pH units <u>and also maintains the</u> stack between pH 3 and pH 10.

- 15. (Previously Presented) The process as recited in claim 14 wherein a buffer solution is a means of maintaining the pH of the ED acid solution to within one pH unit.
- 16. (Original) The method as recited in claim 15 wherein the buffer solution is supplied to the cell compartments via a tank external to the cell compartments.
- 17. (Original) The method as recited in claim 14 wherein controlling the pH in the acid-loop is a means of protecting bipolar membranes and their active sites.
- 18. (Original) The process as recited in claim 15 wherein the buffering solution is added at ambient temperature.
- 19. (Original) The method as recited in claim 14 wherein the electrodialysis cell operates at a temperature which ranges from about  $15^{\circ}$ C to  $40^{\circ}$ C.
- 20. (Previously Presented) The method as recited in claim 14 wherein a buffer solution is added to the stack to maintain the pH of solutions within the stack to within 1 pH unit of said desired pH.
- 21. (New) The method as recited in claim 1 wherein the stack has an effective cell surface area of 0.4 m² (4000 cm²).
